Cropping alternatives methodology

Disclaimer

The following regional forecasts are based on the most current cost of production information from the AgriProfit$ Business Analysis and Research Program and estimates of expected revenues and costs from various sources. Producers should use their own costs and revenue projections to make cropping decisions for farm operations. There is a risk of over or underestimating costs and returns based on regional benchmarks and forecasts. Producers are advised not to base cropping decisions solely on information provided in the following budgets. The Alberta Agriculture and Irrigation crop budgeting software program **CropChoice$** and the **Crop Budget Calculator** are available to customize your own crop budgets. You can download both CropChoice$ software and the Crop Budget Calculator, free of charge.

Prices

Expected market prices are estimates ONLY and based on forecasts for the 2026 crop year. Prices in these budgets are estimated by Agriculture and Irrigation specialists using several price outlook sources. Estimated prices are adjusted to reflect location differences and grade factors. Using one's own price estimates from knowledge of area markets and market outlook information is recommended.

Yields

There is a wide range of yields within each soil zone region. Yield estimates by crop represent average long-term trend yields based on data from Agriculture Financial Services Corporation (AFSC) and AgriProfit$ Program.

Seed costs

Seed costs are based on data collected by the Alberta Farm Input Prices Survey and seed suppliers as well as a seed cost multiplier for a blend of certified and common seed that is cleaned and treated. Seeding rates for each soil zone are based on 1,000 kernel weight for common varieties, 90-95 per cent germination, three to five per cent emergence mortality, and nine-inch spacing. Seeding rates for forages are based on 1,000 kernel weight for common varieties, pure live seeds and a 50-50 split of broadcasted and row seeded plantings.

Fertilizer costs

Prices are based on a combination of the fall 2025 prices, “pre-purchase” prices and fertilizer cost indications for spring 2026. Nitrogen, phosphorous, potassium, and sulphur blends are based on estimated crop requirements for nutrient deficient, stubble-seeded crops in each soil zone.

Nitrogen	**$0.82/lb actual N**	**($832.50/tonne for 46-0-0)**
Phosphorous	**$0.92/lb actual P**	**($1256.23/tonne for 11-52-0)**
Potassium	**$0.52/lb actual K**	**($685.95/tonne for 0-0-60)**
Sulphur	**$0.48/lb actual S**	**($624.16/tonne for 20.5-0-0-24)**

Classification: Public

Soil testing is recommended to optimize the fertilizer budget to field production capacity and crop choice. The Alberta Farm Fertilizer Information and Recommendation Manager (AFFIRM) is an Alberta Agriculture and Irrigation software tool that can help producers optimize fertilizer requirements for crop production. Variable rate technology is also an option being used by producers to maximize production to fertilizer and input expenses. In a mature commodity market, managing costs can mean the difference between farm profitability and farm losses.

Chemical costs

The 2026 chemical costs on stubble-seeded crops include a non-selective, pre-seed burn-off, and one in-crop herbicide application for broadleaf weeds, grassy weeds or both. Feed barley acreage sprayed for broadleaf weed control and a portion sprayed for wild oat control. Fungicides, insecticides and/or pre-harvest/desiccation applications (F/I/PH/D) are indicated.

Hail/crop insurance

Insurance rates are based on AFSC information, averaged for selected areas in respective soil zones.

Trucking and marketing

For grains and oilseeds, trucking and marketing costs are averages for short-haul and long-haul rates from cost suppliers. For hay, trucking and marketing costs are estimates from suppliers, assuming bales shipped are 1500 lbs and distance hauled is between 50 and 100 kms.

Other costs and levies

These costs which include fuel, oil and lube, machinery repairs, building repairs, pumping costs (irrigation only), labour (paid and unpaid), utilities and miscellaneous, operating interest, and levies are based on information collected by the AgriProfit$ program, Alberta Farm Input Prices Survey, and irrigation specialists. Many of these costs are influenced significantly by differences in regional farming practices.

Operating interest

This is based on a rate of 5.95 per cent per annum for inputs financed such as seed, fertilizer and chemical.

Contribution margin

Contribution margin represents the amount a particular crop contributes to fixed costs and return to management and equity. Use the contribution margin to compare crop choices.

Capital costs by enterprise

Fixed costs generally do not vary greatly from crop to crop but can vary between enterprises and soil zone regions. Average fixed cost profiles by enterprise are included for your information. The capital costs are indexed to reflect costs for the year 2026.

Contribution margin calculation

Value of production - total direct expenses

Total cost per unit calculation

(Total direct expenses + adjusted capital costs) divided by expected yield per acre

Break-Even yield calculation

(Total direct expenses + adjusted capital costs) divided by expected market price

Classification: Public
